ABSTRACT OF THE DISCLOSURE

Contents are supplied from a studio to a plant through a CD-R disc. In the plant, when it is determined that the contents have not been encrypted in accordance with Info_Sheet, a module encrypts the contents with different keys. A key locker creating portion groups the plurality of keys with which the contents have been encrypted, encrypts grouped keys with a disc key, and creates a key locker. A disc image creating portion creates image data to be recorded on a product CD with contents of a first session and a second session and the key locker. In accordance with the image data, the CD is produced. Since keys with which contents have been encrypted are grouped and encrypted, the keys can be prevented from leaking out.
